

Case study 03 · Grantee management

Grantee Management Tech Stack.

A digital operating system for grantmaking teams that brings application intake, review, awards, compliance, and reporting into one coordinated workflow.

-  Centralize grant records
-  Coordinate review and approvals
-  Track awards, reporting, and follow-up

See the workflow →

The problem & approach

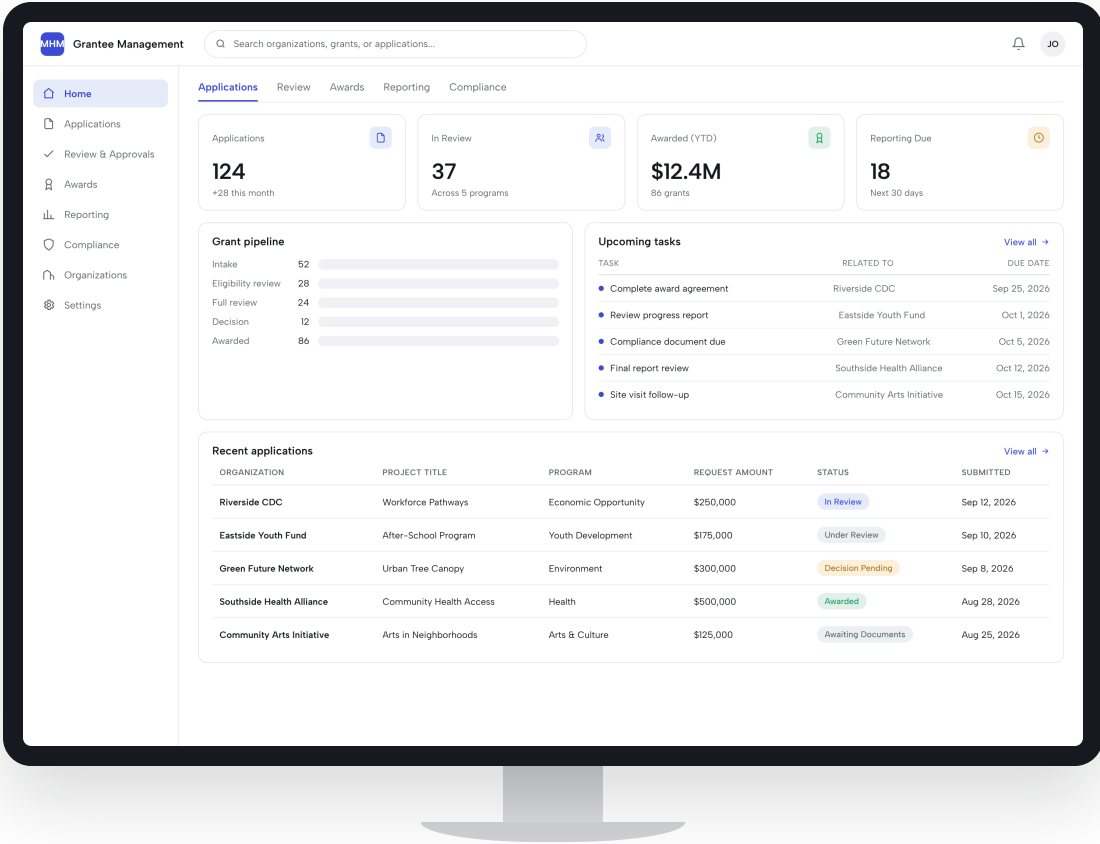

Manage the grant lifecycle, not just the handoffs.

The problem

Grantmaking teams often work across disconnected applications, spreadsheets, email threads, and reporting files. That makes reviews slower, ownership less clear, and follow-up harder to manage.

Why this solution

A shared tech stack connects intake, review, awards, compliance, and reporting in one place, so staff can coordinate decisions and keep grantee information current.

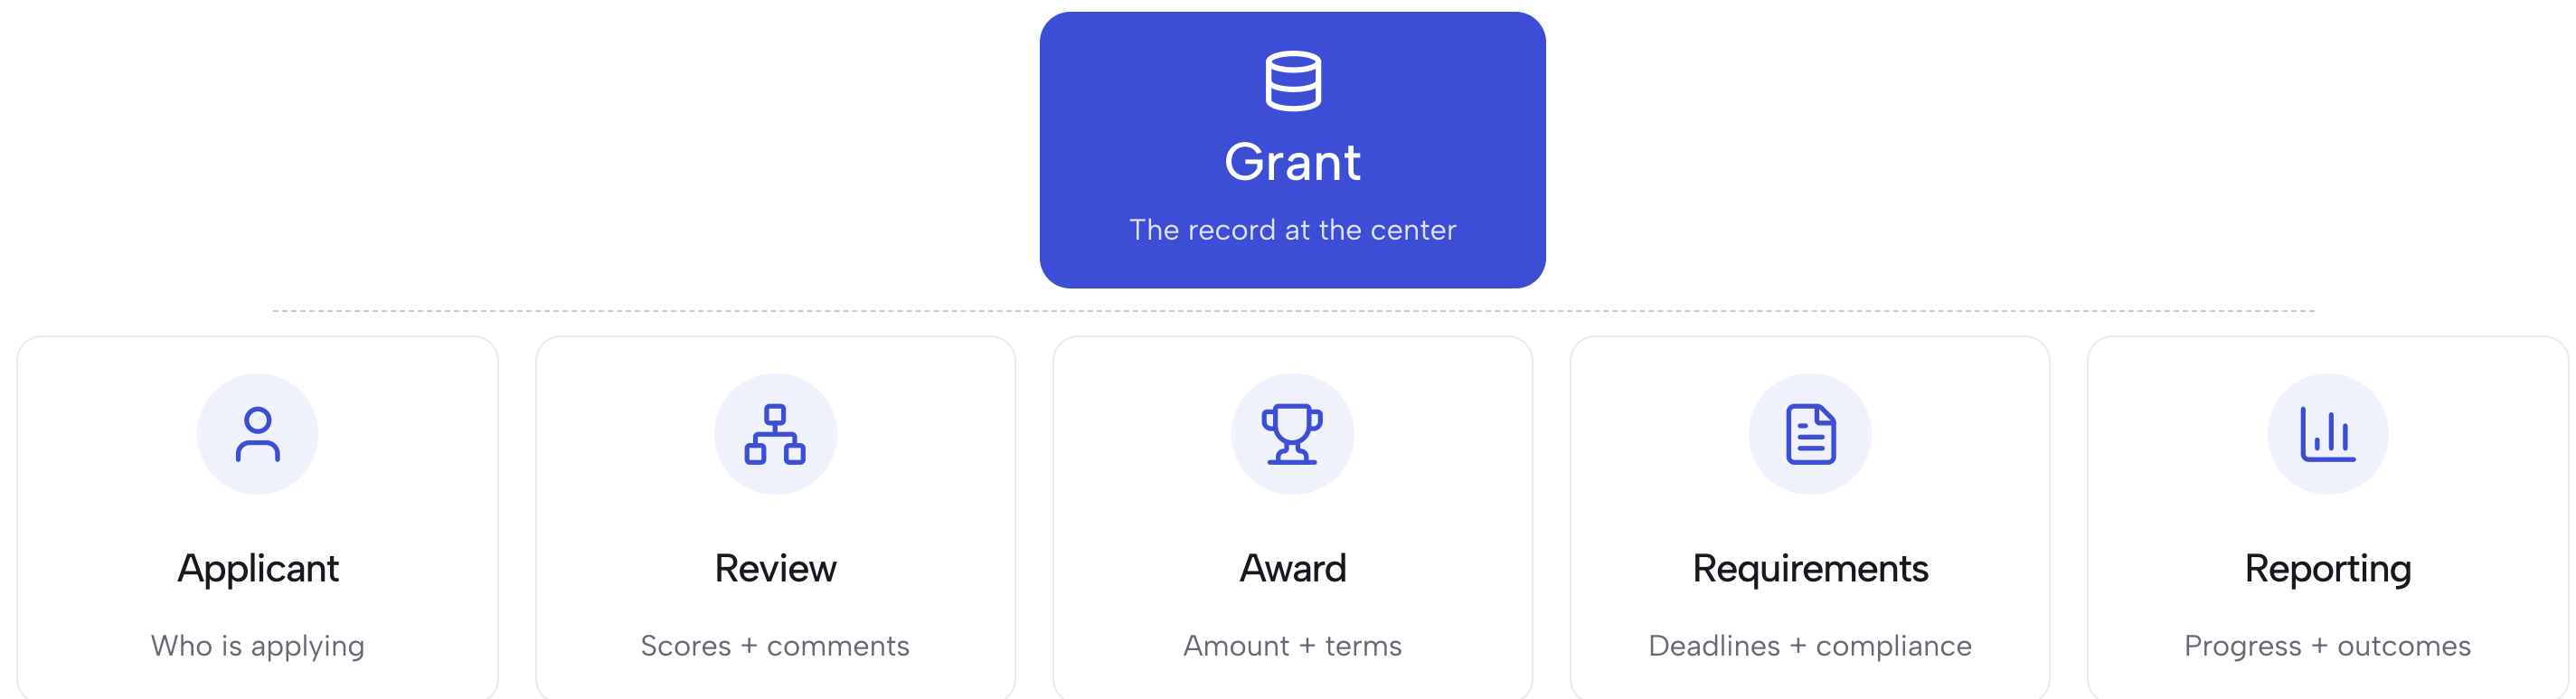

Proposed operating model. Illustrative interface with sample data, not a deployed grantee-management system.

The operating model

The tech stack connects applications to decisions and follow-through.

The system links the applicant record, the grant record, reviewer activity, award requirements, and reporting so teams can move from intake to closeout with context.

One relational record ties the workflow together, from intake through award, compliance, and closeout.
