

A product designed around the service conversation

Support the conversation.

Staff can guide a resident through focused questions, discuss relevant options, and make the next step clearer. The product supports human judgment rather than replacing it.

- Local programs** Surface relevant resources.
- Guided questions** Turn a need into a usable pathway.
- Human judgment** Keep staff in control of the referral.

One responsive web product

Where the **work** happens.

The same web product is designed to work across desktop, tablet, and phone so staff can use it at a desk, side by side with a resident, or in the field.

At the desk**Desktop**

Detailed search and referral work.

Side by side**Tablet**

Shared conversation with a resident.

In the community
Phone

Portable access during outreach.

Build standard

Responsive layout · keyboard usability · readable contrast · English / Español interface

A useful interface depends on
maintained evidence

A living service directory needs governance.

The product is only as useful as the information
behind it. The operating model has to define what
gets stored, who validates it, and how it stays
current

0
1

Source

Program records, service
categories, provider
details, geography.

0
2

Structure

Common fields and
definitions so resources
can be compared.

0
3

Validate

Providers confirm
availability and eligibility;
staff can flag issues.

0
4

Steward

Named ownership and
update paths keep the
directory usable.

The principle: the tool supports referrals. It does not assert that a resident is eligible or that a provider has current availability.

Case study 02 · Regional ecosystem mapping

See the network. See the opportunity.

MHM's ecosystem tool turns a regional set of organizations, grants, services, and relationships into an interactive view that program teams can explore.

Organizations

Connections

Services

Funding

The goal is a shared operating picture: understand who is active, how organizations connect, and where coordination may be useful.

The problem & approach

See the relationships, **not** just the records.

The problem

Understanding a regional ecosystem means seeing who provides which services, where they work, how funding flows, and how organizations connect.

Why this solution

An interactive network makes those relationships visible. Filters and organization details connect the wider picture to funding, reported reach, and service focus.

The interface sits on a relational model

A data model built for ecosystem questions.

The tool connects different kinds of evidence so users can move from a regional pattern to the organizations and relationships.

This structure supports regional filters, organization detail views, and relationship analysis.

From ecosystem to organization

Explore. Focus.

Understand.

Users can filter the network, select an organization, and review grant context, reported reach, and connections without leaving the workflow.

Explore Compare regional relationships.

Focus Filter by service type and grantee status.

Understand Open an organization to see the records behind the node.

MHM · Frontend interaction + analytical workflow

A shared picture for better discussion

Designed for exploration, **not automated decisions.**

The network helps teams ask better questions about an ecosystem. It should inform discussion, coordination, and follow-up rather than automate funding or performance judgments.

Find partners

Identify organizations connected to the same service area or network.

See concentration

Spot where services, grantees, or relationships cluster.

Investigate gaps

Use the map to frame questions about missing or weakly connected capacity.

Ground discussion

Move from an abstract regional picture to specific organizations and records.

The tool is only credible if the evidence
is

Quality is the **operating model**.

For ecosystem tools, accuracy is a continuous practice: define the fields, record provenance, validate changes, communicate gaps, and assign ownership.

Provenance

Know where each record came from.

Definitions

Use consistent categories and time periods.

Validation

Spot-check records and review consequential changes.

Refresh

Define cadence and a named data steward.

Accessibility

Keep filters, labels, contrast, and keyboard flow usable.

Boundaries

State what the data can and cannot support.

A trustworthy tool says what it knows.

- Show reporting periods and source context.
- Distinguish current, past, and non-grantees.
- Treat reported reach as reported evidence, not audited impact.
- Keep a human in the loop for interpretation.

From proven product patterns to your
context

Two tools. A broader capability.

Clark County and MHM show different product patterns built from the same studio capability: domain expertise, data design, frontend delivery, QA, and responsible implementation.

Guided service navigation

Useful when people need to move from a need and place to a practical next step across fragmented programs or services.

Adapt for: public agencies · service networks · digital opportunity programs

Ecosystem intelligence

Useful when teams need a shared view of organizations, relationships, funding, services, or regional capacity.

Adapt for: intermediaries · foundations · regional collaboratives · networks

Bring us the user, the decision, and the operating context. We will scope the product around your need.
